## PRO-SOURCE ${ }^{\oplus}$ Plus

Steel Pressurized Tanks

## APPLICATIONS

- Use wherever pressurized tanks are needed in water systems applications.

## SPECIFICATIONS

Shell - Heavy gauge steel
Base - High-impact composite, ABS
Finish - Electrostatically applied, bakedon polyester paint

Water Cell - One piece seamless PVC, made from FDA listed material

Flange - Reinforced polypropylene
Service Connection - Reinforced polypropylene integral to flange

Air Valve - Rubber stem/brass body Schrader valve assembly

UV Valve Cover - High density polyethylene

## PRO-SOURCE ${ }^{\circledR}$ Plus Steel Pressurized Tanks

## FEATURES

## Heavy Gauge Metal

Construction - Sturdy "welded wrapper and head design." Built to last.

Polyester Paint Finish - Electro-
statically powder painted, then oven baked for a smooth high-gloss, appliance-quality finish. Resists corrosion.

## Elongated, Seamless

## Water Cell

■ Controlled 2-dimensional cell expansion.
■ Rugged, seamless "water cell" prevents the most common cause of pump failure - "waterlogging."

- Water never touches the steel tank material.
- Translucent bag material facilitates manufacturing quality control inspection.

## Composite Sealing Flange

- Corrosion-resistant.

Integral o-ring groove better traps
the water cell's sealing ring.

- Reinforcing ribs strengthen and maintain a flat smooth sealing surface.

Integral Stand Pipe - Keeps the water cell standing erect, promoting complete flushing of the water entering/exiting the tank.

Nitrogen-Rich Precharge - Decreases air permeation three to four times over straight air precharge.

40 PSI Precharge - Ready for use with 40/60 pressure range systems. Enables installer to reduce pressure depending on pressure switch setting.

Sturdy Base - Tested-tough composite construction.

## Tank Sizing Rule:

## Size tank for one gallon

 of drawdown for each gallon per minute at pump capacity.EXAMPLE: For a 1 HP, 20 GPM unit pumping 20 gallons per minute on a 30-50 pressure switch setting, the properly sized PRO-Source ${ }^{\circledR}$ PLUS ${ }^{\text {m }}$ tank is a PS85-T52 which has a 26 gallon drawdown.

Note: Drawdown will be affected by operating temperature of the system, accuracy of the pressure switch and gauge, the actual precharge pressure, and rate of fill.
Pumps installed with a PRO-Source ${ }^{\circledR}$ Plus tank require a relief valve equal to the tank's maximum operating pressure. Relief valve must be capable of relieving entire flow of pump at relief pressure.

*Utilize this chart if proper selection cannot be made using
Chart A. Drawdown based on Boyle's Law.
Procedure: 1. Identify drawdown multiplier relating to specific application
2. Insert multiplier $(X)$ into the following formula:

$$
\frac{\text { Pump GPM x Min Run Time }}{\text { Multiplier }(X)}=\begin{aligned}
& \text { Minimum Tank } \\
& \text { Capacity Required }
\end{aligned}
$$

Example: An example of a 20 GPM pump with a minimum run time of 1 minute, installed on a 50-70 PSIG system pressure range:

$$
\frac{20 \mathrm{GPM} \times 1 \text { minute }}{.24 \text { (factor) from Chart B }}=\begin{aligned}
& 83.3 \text { minimum U.S. gal } \\
& \text { tank capacity required }
\end{aligned}
$$

Referring to "Ordering Information" chart, the model PS85-T52 has the closest U.S. gallon capacity that is greater or equal to the minimum volume requirement of 83.3 U.S. gallons

## OPERATING CYCLE

1. Separator is completely empty - A new cycle is ready to begin. Simple, positive action produces maximum drawdown on every cycle.

2. Water begins to enter the tank - Air is compressed around the water separator as it fills with water.

3. Pump up cycle completed Air is now compressed to the cut-off setting of pressure switch.

4. Water is being drawn from the tank - Compressed air in the tank forces water out of the separator.

## MULTIPLE TANK INSTALLATIONS

PRO-SOURCE ${ }^{\circledR}$ tanks can be connected together to increase the supply of usable water (drawdown). Two tanks of the same size will double the supply and three tanks will triple the supply. See Figures No. 1 and 2 for the typical installations of this kind.

## SEQUENCE OF OPERATION

WATER CELL IS
COMPLETELY EMPTY:
A new cycle is ready to begin. Simple, positive action produces maximum drawdown on every cycle.

## WATER BEGINS TO

ENTER THE TANK:
Air is compressed around the water cell as it fills with water

PUMP-UP CYCLE COMPLETED:
Air is now compressed to the cut-off setting of pressure switch.

WATER IS BEING DRAWN FROM THE
TANK: Compressed air in the tank forces water out of the water cell.
